AutoCAD is designed to be user-friendly and has a large learning curve. The AutoCAD Add-ons market has an estimated growth of \$1.2 billion by 2020 from \$1.3 billion in 2018, an increase of 3.7%. According to a study conducted by analysts at Gartner, by 2022 the total revenue for AutoCAD Add-ons will be in excess of \$4.3 billion, representing over 25% of the total market. The Add-ons Market Forecast for AutoCAD add-on products is expected to be \$4.3 billion by 2022. Of the \$4.3 billion, the Demand Side Platforms Add-ons (DSP) Add-on market is expected to be \$1.5 billion by 2022. A growing trend of DSP software companies selling add-on tools for AutoCAD across the broader DSP platform suite is leading to the growth in the overall market. Programming tools In AutoCAD, programmers can design specific routines for a "traditionally known methodology or commonly-used technology" that is not natively supported by AutoCAD. The project team must create a custom application programming interface (API) for AutoCAD's extended functions. These custom applications are called AutoCAD Add-ons. An example of a custom API application is Microsoft Word's XMLWorkbook. An "external function", or custom API, is a subroutine that is activated by a keystroke, and that is specific to the package. A custom API can either be run directly by AutoCAD, or be run by a third party application via a Win32 API call. The advantage of adding a custom API to AutoCAD is that it provides users with new functionality, which can be customized. AutoCAD can run most Windows API functions through an AutoCAD extension. The custom API functionality is created in AutoCAD by the project team and then the AutoCAD extension is created to run the custom API. The custom API must be supported in all AutoCAD versions. The API can also be reused by other programs. An example of an external function is AutoCAD's native Transparency API. Inline functions An inline function is a "specific task performed by a program for the user." Inline functions are very similar to external functions. Inline functions are designed to simplify the user's workflow. For example, if the user wants 5b5f913d15
