plurality of readings taken at a plurality of discrete locations along a surface of the material are averaged. The invention is particularly applicable in reading magnetic strips along a length of tape or sheet material to obtain information to direct the movement of the material. The development of technology has enabled electronics to provide the ability to determine the speed of travel of a moving sheet of sheet material, the presence of defects,

the quality of the sheet, and the direction of movement of the material.

These developed technologies are normally used in connection with stock manipulation, in the form of direction indicators to drive stock through a machine, and for the purpose of detecting defective materials, for example in the form of a flaw or a foreign particle. The sensing of an electrical or magnetic field is used to obtain information about the sheet of

material. This sensing is normally in the form of a plurality of readings taken at a plurality of discrete locations on a surface of 82138339de
