You can create 3D objects with SimplePotter3D, a software program that will permit you to do so in a straightforward way, allowing you to visualize them. SimplePotter3D is a first 3D creation and handling tool, developed based on this idea: there should be a comfortable and easy-to-use interface with no learning curve, that will enable anyone to create and handle 3D objects. A user should be able to edit, generate and analyze a 3D object. SimplePotter3D also features an innovative interface, that will help users in all kinds of tasks, allowing them to create and manipulate 3D objects. A user simply needs to input a

shape and define an angle.

SimplePotter3D will create and generate a 3D sphere or cube depending on the input. For those willing to visualize their 3D shapes, SimplePotter3D will allow people to define any desired material and visualize the object. Therefore, this will be a 3D creation and handling tool of high quality. By simply pressing the “Create” button, SimplePotter3D will create a 3D object and it will be saved to a file. In case a user wants to edit the created object, they simply need to select the “Open” button and, by pressing the “OK” button, they will be able to open a 3D object in a 3D visualization application. If a user wishes to create many 3D shapes, it

would be more convenient to run SimplePotter3D again and create a new 3D object, rather than using the “Open” button for each one. Furthermore, users will also be able to visualize their 3D objects in different ways. In case of a 3D object, one simply needs to select the right side of a menu and they will be able to do so. By rotating and adjusting the visualization, they will be able to get the desired 3D object, in just a few clicks. Using the “Rotate” button they will be able to rotate the 3D object in any way and the “Change size” button will make the object small, large or its original form, by simply selecting the size. After that, they can use the “Open” button to place this object in a

visual application such as Unity and define a material or make it transparent. Furthermore, the “Exporter” button will enable users to export the 3D object to external applications

SimplePotter3D is a free, easy to use application that generates and displays 3D objects in 2D view. It provides a basic package that will allow people to create and visualize 3D objects. The application also offers a “turningdraw” module that will allow users to generate object segments and convert them to 3D objects. However, the “turningdraw” module will erroneously convert the generated objects into other, completely different objects. SimplePotter3D exists in two versions: the Free version and the Live version. Both of them are exactly the same product but priced differently. This is the only difference

between the two versions and the Live version is the only version that supports a Mac OS X desktop. But, the Mac OS X desktop is just a trick to enhance the appearance of the application, because it is the only difference. The whole package is the same but, just the presentation is different. The “ turningdraw” module is of great use, but it has a slight issue. It is quite often that the user connects a series of segments. But, if the user clicks the menu item to close the segments, or if he presses the keyboard “q” key, SimplePotter3D tends to take the position of the last segment that was created. So, if the user changes his mind and connects the next set of segments, SimplePotter3D will not

draw them and it will just place the cursor again. SimplePotter3D requires the user to close the segments that he has already connected. Most of the users are not computer-savvy. They don't want to open the web and download the application, just to get the software. Furthermore, the progress of the software is not the same with other applications. As soon as the user opens it for the first time, it will ask him to choose the preferred screen size, which is a bit annoying. The advantage of this is that he can save the time for the next installations. Most of the users have 1024×768 screens so it is always better to be sure that the selection of the screen size is accurate. They want to have fun by

producing shapes and changing the appearance of them. And they want it to be easy, so that they can do it even if they are not a computer-savvy. Moreover, they want to get a 3D structure of the objects that have been visualized. SimplePotter3D is different from other applications
