How do I set the monitor to another state, how can you select a different color depth and resolution? how... What you need to do is to make sure that your primary I.O. is plugged in (hopefully with the monitor attached), and then run EzTune. Once you do that, EzTune will automatically set the operating system to run in native mode. You then have to deal with the contents of the configuration file that EzTune automatically creates. You can tell EzTune to run in standard or A/V settings, or you can manually move the information around in the file. If you're going to use EzTune to determine color depth/mode, you have to understand a little bit about monitors: for example, an IBM screen uses 16-bit true color and a Sony uses 24-bit true color. A true color mode uses a single color scan of the entire monitor to determine everything about what is on the screen. However, for each of the 24-bit colors, there is a single 8-bit value that represents where that color is on the monitor (1-255). This means that the only information that is not being used to produce the color is the 8-bit byte value in each color at the same location as it appears on the monitor. A 16-bit mode uses two colors (that match the screen's real colors), but there are 16 bits per color value. This means that in every 16-bit color, the 570a42141b
