1. Field of the Invention The present invention relates to a loading system for a portable recording and/or playing device which includes a casing, a record/playback unit movable in a first direction in the casing and a driving mechanism including a driving force transfer means for transferring a driving force to the driving mechanism and a torque limiter for restricting torque of the driving mechanism. 2. Description of the Related Art There has conventionally been provided a portable device such as a portable record player, which includes a casing for storing a tape cassette therein, a motor for driving a tape reel, a fixedly attached driving force transmission path for transmitting a driving force of the motor to the tape reel, and a movable driving force transmission path for transmitting the driving force of the motor to a driving mechanism of the tape recorder, and wherein when the portable device is loaded with a tape cassette, the driving force is transmitted from the driving force transmission path to the driving mechanism through the driving force transmission path. However, there is a problem with such a conventional portable device in that a certain driving force is generated when the driving force is transmitted from the driving force transmission path to the driving mechanism, so that the casing of the portable device may be put under a pressure when the casing is forced to be closed. Therefore, a conventional portable device requires a complex mechanism for restricting the pressure of the casing when the casing is closed. On the other hand, when the portable recording and/or playing device is played back, the tape is guided from the casing to the outside thereof through the driving force transmission path and is rewound in the casing. In this case, the casing is not loaded with a tape cassette but is loaded with a driving mechanism of the portable device. Therefore, when a tape cassette is rewound in the casing, the driving mechanism of the casing comes into contact with the tape cassette through the driving force transmission path. This contact of the driving mechanism and the tape cassette causes the driving mechanism to have a potential of generating heat. Thereby, there is a problem in that the accuracy of signal recording or reproduction may be degraded. Therefore, a conventional portable device needs a driving mechanism which can be prevented from generating heat. Moreover, when the tape cassette is played back, the rotation of the driving mechanism is transmitted to the motor through the driving force transmission path, so that the user of the portable device needs to hold the portable device tightly with one hand and to play the portable device with another hand to reduce the
