Figures and Tables References Category:Software that uses XULLight- and chemically-driven inactivation of sensory transduction within hair cells. The hair cell is the primary sensory cell within the auditory and vestibular systems. Mutations in hair cell genes cause an array of hearing loss, balance deficits, and other defects. A large fraction of hereditary forms of hearing loss and balance deficits are caused by a reduced sensitivity of hair cells to chemical and light stimuli, leading to either inability of hair cells to detect chemicals and light, or to nerve fibers to faithfully transmit the stimuli to the brain. An important class of genes required for hair cell function and survival are those encoding ion channels and receptors. The most well studied of these are those encoding mechanosensory transduction channels. The organization of hair bundles and the stereovilli, the sensory cilia, are among the most prominent morphological features distinguishing these cells from neurons and supporting cells. The molecular composition and the organization of mechanosensory hair bundle and stereovilli transduction channels, along with the mechanisms by which the transduction channels are regulated, are beginning to be understood. Similarly, the repertoire of light and chemical sensors expressed by the hair cell is beginning to be defined. Intriguing new findings including the generation of genetically modified mice with hair cell-specific abnormalities in mechanosensory and mechanotransduction channel genes, and the role of non-thermal bioeffects of acoustic overstimulation, challenge the traditional view that mechanosensory transduction channels are the most critical players in mediating hair cell sensitivity to chemical and light stimuli. Here, we provide an overview of key structural and molecular features of mechanosensory transduction channels, as well as of hair cell light and chemical transduction mechanisms, and their regulation.[The management of hematologic diseases in patients with diabetes mellitus]. Patients with diabetes mellitus frequently present with hematologic disorders in addition to the classical metabolic complications. The aim of this work is to summarize
