For these consumer electronic devices, a need of using a high-voltage power source with 2.7 V~5.5V is rising due to a trend of a battery-powered system in recent years. Many different power conversion topologies can be used to provide a high-voltage output from a low-voltage input. Among others, a synchronous buck converter (alternatively, a current-fed flyback converter) is one of the most widely used converter topologies for SoC systems. In the recent years, as the system-on-chip (SoC) technology becomes popular and the applications of high-voltage converter topologies spread, power management for various applications of various types of converters has been an ever-growing demand. For the synchronous buck converter, power management is mainly focused on switching frequency and switching loss. In an existing method for determining the switching frequency and the switching loss of a synchronous buck converter, the switching frequency and

Q: How to make a local variable refer to a specific variable? In C#, you can use the "ref" keyword to make a local variable refer to a specific variable from outside. It seems to be applied in the following examples: // Here is the variable from outside. int foo = 1; int bar = foo; // and so on... // Assume we don't have access to the variable foo. // How to make bar refer to foo I see there are two ways, but both are somehow strange. First way: using "as": // Here is the variable from outside. int foo = 1; int bar = foo as int; // and so on... // Assume we don't have access to the variable foo. // How to make bar refer to foo I don't know what the technical reason is (if there's any), but every time we do something like this, it would remind me of something. I don't know if it's a good practice or not. A: This is done using either an if statement or a method that returns the right type. In my personal opinion, the if statement is the more clear way to do it. You could also write your own method. To illustrate: int foo = 1; int bar = FooBar(foo); int FooBar(int i) { if(i == 1) return 1; else return -1; } // or class FooClass { public FooClass(int i) { if(i == 1) return new FooClass(1); else return null; } public FooClass() { return this(0); } public FooClass(int i) { if(i == 1

Each time a new faction of creatures is released the rules for monster creation (race, class, gender) are changed. In addition, with each new release a few important changes to the game occur: Creatures added to the game - Lower level races (Scions, Aspects, etc) and Classes (Barbarian, Knight, Mage, Rogue) - New player content that does not come from the base sets. This includes archetypes, archetypes that contain new creatures, creature groups, new races and classes, and new universal creatures. The
