Q: Refresh or terminate threads in Python I'm aware that there are a lot of questions regarding multitithreading in Python but I've not found a solution that works for my situation, either due to the code being too complex or the answer not helping me. I have a thread pool that is being run while the application is alive. The thread pool is being filled with random numbers and made of 1000 threads. After a while the application is terminated but still has the threads running. I want to be able to stop the thread pool and have the threads exit. I can't find a way of stopping the threads without crashing the application, i.e. stopping them with thread.stop(). I can't find a way of having the threads terminate without having them exit, i.e. terminate with thread.join(). Even something as simple as thread.join(10) is not stopping the thread (as it's being joined immediately). It's just preventing the application from crashing (which isn't something I want because I need the threads to stop with an exception or something). import time import threading import multiprocessing from queue import Queue blah = Queue() class Worker(object): def __init__(self, queue): self.queue = queue self.running = True def start(self): self.running = True while self.running: try: whatever = self.queue.get(block=False) except Queue.Empty: pass else: print whatever while not self.running: time.sleep(.01) # Blocking to make sure no one leaves the queue while 1

There is little doubt that ankle sprains are a significant problem. Individuals with a history of recurrent sprains are at an increased risk of recurrent sprains. The long-term cost to the individual and the health care system of a recurrent ankle sprain is significant. There are also social and economic costs associated with a recurrence of this injury. An understanding of the concept of evidence-based medicine is essential when evaluating and treating patients with musculoskeletal injuries. This paper reviews the evidence for therapeutic measures that are used to treat ankle sprains and outlines our management protocols for patients with a history of ankle sprain.Q: How to restart nginx after modifying.htaccess I need to restart nginx after modifying the.htaccess file.
