Photoshop has become a highly effective and popular tool for photo editing, particularly for restoring deleted photos and elements. The process is relatively easy once one learns the basics. Basically, the following steps can be used to transfer images and photos from a film camera, digital camera, or scanner to Photoshop. Ensure that you own Photoshop. An image does not have to be saved to a CD or DVD. Optimize the file size. Start by opening the image. You can open the image by highlighting it or with the drop-down menu. Select Edit, Preferences, Presets. In the drop-down menu, select the Auto Filter option. Go to the Details tab, and toggle the Optimize Colors for Filesize option to ON. This will save space for the file you've created. Go to the Picture size, and select the Width and Height of the JPEG. It is recommended that you should set the JPEG to a maximum of 13 megapixels. There is no need to crop the image. However, if you wish, you can crop the photo. Select Edit, Select, Crop, and crop it to your liking. You can have a vertical or horizontal crop. Use the levels to correct any problems. The exact steps may vary depending on your camera, but most require you to check for the histogram of the image and see if the image is too light or too dark. Go to Edit, Adjustments, Levels, and make any necessary adjustments. Use the curves to correct the image. With the Image Adjustments window open, use the curves tool to make adjustments to levels, curves, and temperature and tint. Open the Photo Filter to change colors. Go to Window, Photo Filters, Photo Filter, and make adjustments as desired. Use the Adjustment Brush to paint over the color and tonal effects. Go to Window, Selection Brush, and select the color and make corrections as desired. Use the Adjustment Layer to make a copy. Go to Layer, New Adjustment Layer, and select the Eraser tool. Erase the areas that should not be included. Save your image. Select Save and add a title to your file. Then save and close the image

Field of the Invention The present invention relates to a system for implementing web services. 2. Description of the Related Art The term "web services" refers to network-based services, such as remote procedure calling, remote procedure invocable, and asynchronous invocation. These services provide Web-based support for distributed processing, distributed data processing, and distributed functions, such as telephone ordering, bank transactions, and online booking. Web services can be used to access a remote service without having to perform a complex sequence of steps. Web services are used to perform operations that are difficult to automate. A web service interface may include a single method that a web application, such as a portal and a client, can call. Web services are typically based on a set of standards or protocols. The standard communications protocol for a web service is usually defined in a contract, which is an XML document, between the web application and the web service provider, which provides the web service. A particular contract describes what information each side sends and receives and how they convert messages to and from the application protocol being used by the web application. Therefore, a web service provider is able to prepare the web services by generating the XML document and then publishing it on a network location. Web services may be accessed using web-based search tools, such as Web Search, Google, and Yahoo. Web service providers are usually equipped with a large number of clients, who can interact with the web service through the web application interface. An example of a commonly known web service is the
