Programming environments AutoCAD comes with an integrated programming environment called AutoLISP. Although using AutoLISP to create applications is not recommended due to its rigid nature, and requires a good understanding of AutoLISP programming, it is still widely used. AutoCAD supports a number of C++

and Visual Basic based APIs for automation, customizing and developing applications for AutoCAD. AutoCAD has a direct C++ programming interface for Windows. AutoCAD also supports a variety of standard programming languages. AutoCAD offers visual programming interfaces (VIs) for various scripting languages including AutoLISP. AutoCAD also offers the COM programming interface. AutoLISP supports over thirty different programming modes, which allows it to be used for many different purposes. AutoLISP is the most popular programming language for customizing AutoCAD, as it is easy to learn, and supports programming for the majority of functions and features available in AutoCAD. AutoLISP is an abstract language, which means that some commands or functions are only supported by a subset of the available language modes. AutoLISP is a "dynamic language" - commands can be used in contextually specific ways, depending on the type of object being modified. To support AutoLISP, AutoCAD can be programmed with Visual LISP, Visual Basic, and other languages such as JavaScript, AutoLISP. For more information on the various modes and syntax, visit the AutoLISP page on the Autodesk website. AutoLISP is an object-oriented language, so it is possible to write a function that can be called on multiple objects simultaneously. This is not possible in general in many other programming languages. Furthermore, AutoLISP supports many programming paradigms that are not available in most other languages. The use of multiple threads within a single process is especially common. However, even in general programming, more than one thread is used very rarely, as it is normally more efficient to use threads in separate processes. This is done in AutoCAD by using App Objects. AutoLISP includes a number of functions and operators for dealing with numeric values. This allows programmers to integrate numeric calculations into their AutoLISP scripts. AutoLISP is also an imperative programming language. This means that statements in AutoLISP are executed in a particular order
