Structure AutoCAD Architecture software consists of a programming library called Architecture Studio, which is implemented as a Visual Basic for Applications (VBA) module that is used for customizing and automating AutoCAD. The core of AutoCAD Architecture software is a design software application called ObjectARX. AutoCAD Architecture Design Studio can be integrated with external applications through COM and .NET object models. The ObjectARX COM component and .NET class library are also used as the basis for AutoCAD Architecture Windows Forms and WPF clients. AutoCAD Architecture software architecture includes a Design Studio, a Client Viewer, a Client Runtime and a Server Runtime. Design Studio The primary purpose of Design Studio is to provide a standard environment for the user to develop customizations of all sorts, with the ability to inspect the newly-customized code, making it available to the client and server. The AutoCAD Architecture Design Studio consists of the following components: Design Studio Builder: a tool for creating a design package (RFD), a drawing template or a MDS file Design Studio Client Runtime: a VBA-based design package editor that can be added to Microsoft Office applications, such as Word, Excel and PowerPoint Design Studio Server Runtime: a COM and .NET class library and VBA module that can be used to create design packages Client Viewer The Client Viewer provides an interactive and graphical interface that allows the user to add, modify or delete objects, properties and layers of a design package. The Client Viewer is based on Microsoft Silverlight technology. It allows third party content to be embedded in a design package, be it an image, vector drawing or a text file. It also allows adding of UML models or design packages created with other software to a design package. Client Runtime The Client Runtime provides the following functionality to a designer or developer: Access to all drawings and design packages contained in an ArcGIS map server or any database server. Provide the ability to modify a design package using the .NET/COM client runtime in an application. Allow attaching custom entities to geometry, attributes, or documents. Allows the use of .NET and COM classes in designing, programming, and authoring a design package. Provide the ability to add, edit, and delete components. Provide access to registered design elements. Provide the ability to track modifications made to a design package. Server Runtime
