A functional polymorphism in DRD2 is associated with faster learning in healthy young men. The dopamine D(2) receptor (DRD2) is involved in higher cognitive functions, such as learning and memory. Several lines of evidence suggest that DRD2 may be a functional candidate for schizophrenia. We analyzed the association of DRD2 exon 1 duplication polymorphism (G(158)A) with learning capacity and striatal DA content in healthy young men. We also investigated the association of G(158)A with the response to a stimulant drug in healthy young men. We examined the association between the DRD2 exon 1 duplication polymorphism (G(158)A) and learning capacity in 979 healthy Caucasian men, with mental speed and cognitive function estimated by the Wechsler Adult Intelligence Scale-Revised (Wechsler, 1994), and brain DA with SPECT imaging. The prevalence of the low penetrance allele A was 0.24. Subjects carrying an A allele showed a faster learning speed and, more importantly, better cognitive performance. The effect of the A allele on learning speed was not dependent on striatal DA, nor on the presence of a comorbid depressive disorder. We also showed that the A allele was associated with decreased metabolic activity in a region of the striatum thought to be involved in the cognitive processes that are impaired in schizophrenia. The DRD2 exon 1 duplication polymorphism is associated with increased cognitive functions in healthy subjects. The results provide evidence that alterations in the D(2) receptor may affect dopamine-related cognition, and suggest a role of the DRD2 gene in the normal cognitive functions of subjects without schizophrenia.Extraction of proteins from plants using liquid-liquid extraction followed by immobilized metal affinity chromatography. Immobilized metal affinity chromatography (IMAC) has been developed for the purification of recombinant antibodies and other proteins. Since immobilized metal ions are usually chelated to resins, their availability at later stages is an important issue, especially for the purification of His-tagged proteins. We have thus established a technique of using liquid-liquid extraction of the His-tagged recombinant proteins produced in Escherichia coli followed by IMAC. Using this method, His-tagged proteins can be conveniently and efficiently extracted from E. coli whole-cells and isolated without consuming excessive amounts of metal ions.Quality of life after total-body irradiation for lymphoma. The data means the economy is currently only just meeting the Bank of Japan's growth target of 2 per cent plus for the year, a feat it has not achieved since before the March 2011 earthquake and nuclear crisis. Ahead of release of the second quarter data, government officials hinted that the BoJ will need to ease policy further to achieve the target. The government forecast growth of 3.0 per cent for the full year, with a range of 2.8 per cent to 3.4 per cent. The median estimate of 26 economists surveyed by Bloomberg was 3.1 per cent. The government's statistics agency said there was a decrease in the yen's value, partly as a result of foreign investors buying assets abroad that were more likely to increase in price when the currency moves. It also benefited from a surplus in the first quarter, while farm income and the value of consumption based on household data surged. A stronger yen is the "major threat" to the economy, Deputy Finance Minister Akihiro Ohira said after the data release. "If the trend in the yen continues, the economy will be weaker." Domestic spending rose 3 per cent from a year earlier in the quarter, surpassing analysts' forecasts in part because of strong purchases by households and firms
